May 1958

SUPERVISORS SHOULD REPORT ALL LACTATION RECORDS (718's)

Lactation records (718's) are currently being received by the Branch at an all-time high rate. Even so, not all available lactation records being completed in DHIA herds are reported for use in proving sires. On the average, each supervisor should be reporting 2 or 3 lactation records (718's) from each herd each month. Although the calculation of DHIA records in some States is mechanized and the records are processed in computing centers, as yet most DHIA records are calculated manually on the farm by the DHIA supervisor.

DHIA supervisors who manually calculate records should be urged to report all lactation records promptly as they are completed. Though there may be immediate plans to mechanize the record calculation work of a herd there should be no "let up" in reporting all available lactation records up to the time of mechanization of the record work. Otherwise the records will be lost for use in proving sires. A proved sire record to be most reliable must include the records of all the daughters of a sire as well as the records of the dams of the daughters.

A 718 report should be made on every cow in the herd when:

- (1) The cow completes her 305-day lactation record.
- (2) The cow goes dry in less than 305 days of her lactation period.
- (3) The lactation record of the cow is interrupted by -
 - (a) Sale.
 - (b) Death.
 - (c) Abortion after carrying a calf 152 days or more.

All short-time interrupted records should be reported regardless of the number of days the cows are in milk.

ON THE AVERAGE, EACH SUPERVISOR SHOULD BE REPORTING 2 OR 3 LACTATION RECORDS (718's) FROM EACH HERD EACH MONTH.

DHIA PROVED-SIRE RECORDS TABULATED IN APRIL 1958

Following is a list of 404 sires whose records were tabulated or retabulated by the Animal Husbandry Research Division in April 1958. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
